

Redline RE-SBCBG Blow Gun Installation Instructions

This is a universal kit designed to allow the installation of an air blow gun to nearly any pneumatic air tool. Depending on the threads of the inlet to the tool you're incorporating this kit, you may or may not need to supply an adapter so that the tee fitting can be connected to your device. The photos below use the Redline REPP70 media blast cabinet as an example of connecting this blow gun kit to a media blast cabinet. Drill a 1/2" diameter hole into the cabinet near the air inlet, making sure the hole is appropriately placed for the air line to enter the cabinet at your desired location, clean up the hole edges with a reaming tool or file, insert the supplied rubber grommet, run the air hose from this kit through the new hole, and connect the air blow gun to the tee fitting as shown.
